

**Part 1: Preliminary Assessment**  
**Wednesday, August 29**

# Condensation on cool surfaces; Consequential large scale mold growth

Photo Courtesy of Philip Morey

Keep indoor dew point less than 55°F?

# Cellulosic Spray-on Fire Proofing Applied Wet During Construction

Fireproofing that is applied wet to structural surfaces must be allowed to dry within the time frame recommended by the manufacturer

Photo Courtesy of Tom Rand and Philip Morey

Photo Courtesy of Tom Rand and Philip Morey

Abundant Stachybotrys spores and conidiophores are present in the wet-applied cellulosic fireproofing sprayed on ceilings and beams in a new building. The moldy fireproofing was removed and replaced with a fireproofing containing a minimal amount of biodegradable components.

# Moisture Failure in Crawl Space During Construction

Photo Courtesy of Philip Morey

RH in crawl space 75 to 95%; Note mold growth on OSB

**What Is All This Fine Particle Dirt On  
The Airstream Surfaces Of HVAC Air  
Supply Ducts Doing To IAQ? How  
Many OLFS?**

# Diagnostic Sampling Considerations

## Wednesday August 29 Discussion

# Culturable Half Life of Molds? How Accurate?

- When collecting mold spores by filtration, it is important to note that some mold spores (e.g., *Penicillium*, *Aspergillus*, *Eurotium* species) have a longer half life or are more desiccation-resistant than other spores (e.g., *Cladosporium*, *Epicoccum*, *Stachybotrys* species). See AIHA Field Guide, 2005, pp. 99. Need more study of mold spore half lives.

# Dust Samples

- In terms of sampling strategy, pre-determine if dust samples should be collected from above floor surfaces (Pinard et al., 2005, Saratoga Springs Conf., pp 191) or from floor surfaces.
- Pre-determine if dust samples are to be analyzed (for fungi) by direct plating (more ecological important species detected) or dilution plating (may overemphasize species with longest half lives). See AIHA Field Guide, 2005, pp. 120 and 58.

# Dust Samples

*Stachybotrys* in carpet dust assessed by different types of lab analysis:

<u>Analysis</u>	<u><i>Stachybotrys</i> Concentration</u>	<u>%<i>Stachy</i> Among Taxa</u>
Dilution on MEA	$1 \times 10^3$ cfu/g	5%
PCR (24 Target)	$1 \times 10^7$ spore equivalents/g	> 95%

Morey, 2007, Chapter 3. Which is correct? Can the PCR data be repeated 2 years later?

# Mold Remediation Overview

Wednesday August 29 Discussion

Why is it Important to Contain Dusts During Mold Remediation?  
 Rank Order Taxa of Mold Spores Outdoors and Indoors within Containment  
 Prior to and During Removal of Moldy Wallboard (Spore Trap Analysis)

<u>Fungal Taxa</u>	<u>Spores/M<sup>3</sup></u>
<u>Outdoor Air on Roof</u>	
Basidiospores	370
<u>Penicillium/Aspergillus</u>	90
<u>Cladosporium</u>	70
Ascospores	55
<u>Indoors in Room Prior to Removal</u>	
Basidiospores	150
<u>Penicillium/Aspergillus</u>	25
<u>Stachybotrys</u>	25
<u>Cladosporium</u>	10
Ascospores	10
<u>Indoors Within Containment During Removal</u>	
<u>Penicillium/Aspergillus</u>	220,000
<u>Stachybotrys</u>	21,500
<u>Cladosporium</u>	12,000
Ascospores	4,500
Basidiospores	4,250

Sampling period 5-10 minutes except for short term (<0.5 minute) samples collected during demolition;  
 N = 4 to 8. Need excellent PPE. From Morey 2011.

Why is it Important to Contain dusts During Mold Remediation?  
Rank Order Taxa of Mold Spore Equivalents (SE) in Containment During  
Mold Remediation and in the Outdoor Air

Fungal Taxa	SE/M <sup>3</sup>
<u>Outdoor Air on Roof</u>	
<i>Aspergillus niger</i>	2
<i>Aspergillus fumigatus</i>	1
<i>Cladosporium cladosporioides</i>	1
<u>Indoors Within Containment During Wall Removal</u>	
<i>Stachybotrys chartarum</i>	50,000
<i>Penicillium chrysogenum</i>	4,000
<i>Aspergillus sydowii</i>	2,900
<i>Chaetomium globosum</i>	400
<i>Aspergillus versicolor</i>	100

Note: Air sample collected on fiberglass filter for >1.0 hr.; PCR analysis. Need Excellent PPE! From Morey 2011.

**Mold Remediation: Sampling  
Interpretation Difficulties;  
Wednesday August 29 Discussion**

# Rank Order Taxa Concentrations of Culturable Fungi Indoors and Outdoors After Mold Remediation

<u>Fungal Taxa</u>	<u>Average Conc. (CFU/M<sup>3</sup>)</u>
<u>Outdoor Air on Roof</u>	
<i>Cladosporium cladosporioides</i>	15
<i>Curvularia lunata</i>	11
<i>Penicillium implicatum</i>	5
<i>Penicillium brevicompactum</i>	3
<i>Aspergillus fumigatus</i>	3
<i>Drechslera hawaiiensis</i>	2
<i>Aspergillus japonicus</i>	2
<u>Outdoor Air at Grade Level</u>	
<i>Penicillium brevicompactum</i>	36
<i>Curvularia lunata</i>	18
<i>Alternaria alternata</i>	8
<i>Penicillium implicatum</i>	7
<i>Aspergillus alliaceus</i>	4
<i>Aspergillus japonicus</i>	3
<i>Emericella rugulosa</i>	3
<u>Indoor Air in Formerly Moldy Rooms</u>	
<i>Emericella rugulosa</i>	5
<i>Cladosporium cladosporioides</i>	2
<i>Cladosporium sphaerospermum</i>	2
<i>Penicillium citreonigrum</i>	2
<i>Curvularia lunata</i>	2
<i>Penicillium sclerotiorum</i>	1
<i>Penicillium brevicompactum</i>	1

N = 4 for outdoor air; N = 7 indoor air; laboratory #2 accredited by the American Industrial Hygiene Association, Environmental Microbiology Proficiency Analytical Testing Program. Malt extract agar; culture plate impactor operating at a flow rate of about 0.2m<sup>3</sup>/minute. Should outdoor air controls be taken at grade or roof levels? From Morey 2011

## Rank Order Taxa Concentrations of Culturable Fungi Indoors and Outdoors Before Mold Remediation. Is it *Cladosporium Herbarum* or *Cladosporium cladosporioides* in Outdoor Air?

Fungal Taxa	Average Conc. (CFU/M <sup>3</sup> )
<u>Outdoor Air on Roof</u>	
<i>Cladosporium herbarum</i>	298
<i>Aspergillus niger</i>	27
<i>Eurotium amstelodami</i>	22
<i>Cladosporium sphaerospermum</i>	15
<i>Penicillium citrinum</i>	12
<i>Penicillium purpurogenum</i>	12
<i>Penicillium chrysogenum</i>	10
<i>Aspergillus flavus</i>	10
<u>Outdoor Air at Grade Level</u>	
<i>Cladosporium herbarum</i>	261
<i>Alternaria alternata</i>	14
<i>Aspergillus niger</i>	10
<i>Cladosporium sphaerospermum</i>	8
Yeasts, <i>Sporobolomyces</i>	6
<u>Indoor Air in Moldy Rooms</u>	
<i>Wallemia sebi</i>	640
<i>Penicillium brevicompactum</i>	146
<i>Eurotium amstelodami</i>	136
Yeasts, <i>Sporobolomyces</i>	89
<i>Cladosporium sphaerospermum</i>	80
<i>Aspergillus ochraceus</i>	42
<i>Emicella</i>	22
<i>Penicillium citrinum</i>	25

Note: n = 4 for outdoor air; n = 7 indoor air; laboratory #1 accredited by the American Industrial Hygiene Association, Environmental Microbiology Proficiency Analytical Testing Program; culture conditions: Malt extract agar; culture plate impactor operating at a flow rate of about 0.2m<sup>3</sup>/minute. From Morey 2011.

## Rank Order Taxa Of Moulds Detected In The Same Two-Year-Old Dust Sample Using Different Analytical Methods

### PCR Analysis

<i>Stachybotrys chartarum</i>	81%
<i>Penicillium roquefortii</i>	3%
<i>Cladosporium cladosporioides</i>	2.5%
<i>Eurotium amstelodami</i>	2.5%
<i>Aspergillus fumigatus</i>	2.5%
<i>Alternaria alternata</i>	2.5%

### Dilution Plating on CMA

<i>Penicillium spp.</i>	70%
<i>Stachybotrys chartarum</i>	20%
<i>Aspergillus niger</i>	10%

### Direct Plating on CMA

<i>Penicillium spp.</i>	50%
<i>Ulocladium botrytis</i>	20%
<i>Stachybotrys chartarum</i>	10%
<i>Chaetomium globosum</i>	10%
<i>Acrodontium spp.</i>	10%

PCR = Polymerase chain reaction; CMA = cornmeal agar. Dust sample was sieved and homogenized in the laboratory and aliquotes of the dust sample were processed separately by PCR, direct plating and dilution plating methods. Which is best? From Morey 2011
